Abstracts

Receiver-in-the-canal (RIC) hearing aids, also referred to as receiver-in-the-ear (RITE) or canal receiver technology (CRT), are smaller than standard Behind the Ear (BTE) models, but are easy to maneuver and can still house a variety of features. Like standard BTEs, they can be worn comfortably behind the ear. However, unlike regular BTE hearing aids, the RIC's loudspeaker or 'receiver' is located outside the housing and positioned at the end of a thin earwire, placed near the ear drum. Since generated sound only has to travel a very short distance with lower transmission loss, less sound energy (and battery power) is required to produce a superior listening experience. This hearing aid is placed like an earplug in the ear canal.

The global Receiver In Canal Ric Hearing Aids market size was estimated at USD 550.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
