Abstracts

The recirculating ball mechanical steering gear is an integral part of the automobile steering system. It is mainly composed of screws, nuts, steering gear housings, and many small steel balls. These small steel balls are placed in a closed pipeline between the nut and the screw. Their function is to convert the sliding friction between the nut and the screw into rolling friction with less resistance. When the steering wheel rotates, the screw pushes the nut to move up and down, and the nut drives the steering rocker arm to swing back and forth through the gear, thereby achieving steering. This design improves transmission efficiency and makes operation lighter and more comfortable.

The global Recirculating Ball Mechanical Steering Gear market size was estimated at USD 1280.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.15% during the forecast period.
