Abstracts

The recirculating ball steering gear is mainly composed of screw, nut, steering gear housing and many small steel balls. The so-called circulating ball refers to these small steel balls, which are placed in the closed pipeline between the nut and the screw rod. , to transform the sliding friction between the nut and the screw into rolling friction with less resistance. When the screw fixed to the steering column rotates, the screw pushes the nut to move up and down, and the nut drives the steering through the gear The rocker arm swings back and forth to achieve steering. During this process, those small steel balls roll back and forth in the closed pipeline, so this kind of steering gear is called a circulating ball steering gear.
