### Report Overview

Recombinant Follicle-Stimulating Hormone (FSH) Injections are a type of fertility medication that is produced through genetic engineering techniques. These injections contain a recombinant form of FSH, a hormone that plays a crucial role in the development of follicles in the ovaries and the production of eggs in females. The product is designed to stimulate the growth of multiple ovarian follicles, which can then be harvested for in vitro fertilization (IVF) procedures or to induce ovulation in women with infertility issues. Recombinant FSH injections are considered more consistent and less allergenic compared to urinary-derived FSH, as they are synthesized in a controlled laboratory environment, reducing the risk of contamination and adverse reactions. This product is typically prescribed by healthcare professionals to assist in fertility treatments and is administered under medical supervision.
