Report Overview

Recombinant Glycosylated Proteins Biosimilar is a type of biopharmaceutical product that is developed to closely mimic the structure, function, and efficacy of an existing, approved glycoprotein-based drug. This product is created using recombinant DNA technology, which involves inserting the gene encoding the desired glycoprotein into a host organism, such as bacteria, yeast, or mammalian cells. The host organism then produces the protein, which is subsequently purified and processed to ensure it closely resembles the original drug in terms of glycosylation patterns, which are crucial for protein function and stability. A biosimilar is not a generic version of the drug, but rather a separate product that has been shown to be highly similar to the reference product in terms of safety, purity, and potency through extensive preclinical and clinical studies. The development of recombinant glycosylated protein biosimilars aims to provide more affordable and accessible treatment options for patients while maintaining the efficacy and safety of the original biologic drug.
