Report Overview

Recombinant Human Epidermal Growth Factor (rhEGF) Solution is a biotechnological product that involves the use of recombinant DNA technology to produce a protein known as Epidermal Growth Factor (EGF). EGF is a naturally occurring protein that plays a crucial role in cell growth, proliferation, and differentiation, particularly in the epidermis, the outer layer of the skin. The rhEGF solution is synthesized in a laboratory setting, often using a host organism such as bacteria or yeast, which is genetically modified to express the human EGF gene. This solution is typically used in various medical and cosmetic applications, including wound healing, tissue repair, and skin rejuvenation. It is designed to mimic the body's natural EGF, promoting the regeneration of skin cells and enhancing the skin's natural healing process. The product is formulated as a solution, which allows for easy application and absorption, making it a versatile tool in dermatological and cosmetic treatments.
