Abstracts

Reconfigurable Intelligent Surfaces (RIS) are advanced electromagnetic surfaces designed to dynamically control and manipulate wireless signals in a highly efficient and programmable manner. RIS consists of an array of passive or active elements, such as meta-materials or phase-shifting units, that can adjust the phase, amplitude, and polarization of incident electromagnetic waves in real-time. This technology enhances the performance of wireless communication systems by intelligently redirecting signals, improving coverage, reducing interference, and enhancing data rates without the need for additional power-hungry infrastructure. RIS can be controlled via software, allowing it to adapt to changing environments and optimize wireless signal propagation, making it a promising solution for next-generation wireless networks, such as 5G and beyond, smart environments, and the Internet of Things (IoT).

The global Reconfigurable Intelligent Surfaces Ris market size was estimated at USD 1250.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 32.15% during the forecast period.
