Report Overview

Recycled Foundry Sand is a type of byproduct material that originates from the foundry industry, specifically from the process of casting metals. In this process, sand is used as a mold material to shape the molten metal into desired forms. After the casting is completed, the sand is removed, and it can be reused or recycled. The recycled foundry sand is typically processed to remove any residual metal, dust, and other impurities, making it suitable for reuse in various applications such as construction, agriculture, and even back into the foundry process. This recycling not only conserves natural resources but also reduces waste and environmental impact, contributing to a more sustainable industrial practice.
