Abstracts

Lead tetroxide, commonly known as red lead, is an inorganic compound with the chemical formula Pb_3O_4 . It is a bright orange-red powder. It is insoluble in water and ethanol, but soluble in hot alkali solution, dilute nitric acid, acetic acid, and hydrochloric acid. It is mainly used as an anti-rust pigment and an oxidant in organic synthesis. It can also be used to make batteries, glass, ceramics, and enamel. Lead tetraoxide can be used as an inorganic red pigment. The coating industry is used to make anti-rust paint and steel protective coatings with good anti-rust properties. The glass and enamel industry is used to make enamel and optical glass. The ceramic industry is used to make ceramic glazes. The electronics industry is used to make piezoelectric components. The battery industry is used to produce batteries. The machinery industry is used for metal grinding. The organic chemical industry is used to make dyes and other organic synthetic oxidants. It can be used for rubber coloring. The pharmaceutical industry is used to make ointments, hard pastes, etc. Due to the potential hazards and regulatory restrictions associated with lead compounds, it is unlikely that PbO_4 will be produced in large quantities commercially or widely used. The market outlook for PbO_4 is expected to remain limited due to safety concerns and the availability of alternative materials that can be used for similar purposes without the risks associated with lead.

The global Redlead (Lead Tetroxide) market size was estimated at USD 191.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
