Report Overview

Reflective Roofing Membrane is a specialized type of roofing material designed to minimize heat absorption and reduce the overall temperature of a building's roof. This product typically consists of a highly reflective surface layer, often made from materials such as white or light-colored granules embedded in a polymer matrix, which helps to reflect sunlight and ultraviolet (UV) radiation back into the atmosphere. The objective is to decrease the amount of heat absorbed by the roof, thereby reducing the cooling load on the building's HVAC system and lowering energy consumption. Reflective Roofing Membranes are often used in commercial and residential buildings, particularly in regions with high temperatures or intense sunlight, to improve thermal comfort and reduce energy costs. They may also contribute to the sustainability of a building by reducing the urban heat island effect and enhancing the overall environmental performance of the structure.
