### Report Overview

The rehabilitation traction bed is a specialized medical device designed to alleviate pain and improve mobility by applying controlled mechanical traction to the spine or joints, primarily used in physical therapy, chiropractic care, and post-surgical recovery. It employs adjustable tension and positioning to decompress vertebrae, reduce nerve pressure, and enhance circulation, making it particularly effective for treating conditions like herniated discs, sciatica, and chronic back pain. Modern variants often integrate advanced features such as electric controls, heat therapy, and programmable settings to customize treatment protocols. The device caters to both clinical settings and home healthcare, with demand driven by an aging population, rising prevalence of musculoskeletal disorders, and increasing preference for non-invasive pain management solutions. Market growth is further supported by technological advancements, insurance coverage for therapeutic equipment, and heightened awareness of spinal health. However, adoption may be constrained by high costs, limited reimbursement policies in certain regions, and competition from alternative therapies like manual manipulation or surgical interventions.
