Abstracts

Relaxor ferroelectric single crystal is a special ferroelectric material with excellent piezoelectric and electrostrictive properties. Unlike traditional ferroelectric materials, relaxor ferroelectric single crystals exhibit strong relaxation behavior, that is, under the action of an external electric field, its polarization reaction is delayed with changes in temperature and electric field. This type of single crystal material usually has a high piezoelectric coefficient, electromechanical coupling coefficient and low dielectric loss, so it is widely used in high-precision sensors, ultrasonic transducers and medical ultrasound equipment. Common relaxor ferroelectric single crystals include PMN-PT, PZN-PT, etc., which are particularly suitable for occasions requiring high sensitivity and high energy conversion due to their excellent electrical and mechanical properties.

The global Relaxor Ferroelectric Single Crystal market size was estimated at USD 180.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
