### Report Overview

The Renal Denervation (RDN) System is a minimally invasive medical device designed to treat hypertension, or high blood pressure, by selectively disrupting the renal nerves that are involved in regulating blood pressure. This system typically consists of a catheter and a control unit, which work together to deliver radiofrequency energy to the renal arteries. The procedure is performed by inserting the catheter into the femoral artery and guiding it to the renal arteries, where the energy is applied to the nerves, thereby reducing their activity. The RDN System aims to provide a non-pharmacological alternative for managing resistant hypertension, potentially reducing the need for medication and improving patient outcomes. It is an innovative approach that leverages the body's own nervous system to achieve a therapeutic effect, offering a new dimension in the treatment of cardiovascular diseases.

In 2024, the global Renal Denervation (RDN) System market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
