Report Overview

A Resistive Wind Direction Sensor is a meteorological instrument designed to measure the direction from which the wind is blowing. This device typically consists of a wind vane, which is a rotating arm or pointer that aligns itself with the wind direction. The sensor uses resistive technology to detect the position of the wind vane, converting the mechanical movement into an electrical signal. This signal is then processed to provide a digital output that indicates the wind direction, often in degrees relative to true north. The resistive wind direction sensor is known for its durability, accuracy, and reliability, making it suitable for various applications, including weather stations, aviation, marine navigation, and environmental monitoring. It is an essential component in meteorological data collection, providing crucial information for weather forecasting and climate studies.
