Report Overview

The Respiratory Syncytial Virus (RSV) Vaccine for Children is a preventive medical product designed to protect young children, particularly infants and toddlers, from the potentially severe respiratory infections caused by the RSV. This vaccine works by introducing a weakened or inactivated form of the virus or its components into the child's body, stimulating the immune system to produce antibodies against RSV without causing the disease. The goal is to reduce the risk of severe illness, hospitalization, and complications associated with RSV infections, which are common in young children and can lead to bronchiolitis and pneumonia.
