Report Overview

Reverse Multilayer Ceramic Capacitors (MLCCs) are a type of passive electronic component designed to store electrical energy in an electronic circuit. These capacitors are constructed by layering alternating thin layers of ceramic dielectric material with conductive electrodes, typically made of metal such as nickel or copper. The "reverse" in the name refers to the orientation of the electrodes, with the outer layers serving as the termination points, which is the opposite of traditional MLCCs where the inner layers are connected to the terminations. This design allows for a more compact and robust structure, enhancing the capacitor's performance in terms of capacitance, voltage rating, and reliability. Reverse MLCCs are widely used in various electronic devices due to their small size, high capacitance density, and ability to operate over a broad range of temperatures and voltages. They are particularly beneficial in applications requiring high performance and miniaturization, such as in mobile devices, automotive electronics, and high-frequency circuits.
