Report Overview

Reverse Treated Foils (RFT) are specialized metal sheets or films that have undergone a unique treatment process to enhance their properties and performance. This treatment involves applying a specific coating or chemical process to the reverse side of the foil, which is the side opposite to the one that is typically exposed or visible. The purpose of this treatment can vary, but it often aims to improve characteristics such as adhesion, barrier properties, reflectivity, or heat resistance. RFTs are used in a wide range of industries, including packaging, construction, automotive, and aerospace, where their enhanced properties provide benefits such as increased durability, improved aesthetics, or specific functional performance. The treatment process is carefully controlled to ensure uniformity and consistency across the entire surface of the foil, making RFTs a reliable choice for applications that demand high-quality performance.
