Abstracts

The right double-lumen endobronchial tube, also known as the White tube, is a specially designed endotracheal tube that contains two separate tubes for ventilation and suction. The main feature of this tube is that its design allows it to enter and be fixed in the patient's right common bronchus, thereby achieving the function of ventilation and management of the right and left lungs respectively. The structure of the right double-lumen endobronchial tube usually includes a right tube cuff with a window hole on it, which is exactly aligned with the right upper lobe bronchial opening. This design is intended to ensure smooth ventilation there and prevent sputum obstruction. The right double-lumen endobronchial tube is widely used in thoracic surgery and occasions where precise control of breathing is required. By inserting it into the right common bronchus, doctors can ventilate, suction or anesthetize the right lung alone while maintaining normal ventilation or performing other operations on the left lung. The use of this catheter helps prevent sputum or blood from the diseased lung from flowing into the healthy lung, achieving a good lung isolation effect and reducing the risk of cross-infection and pathogen spread.

The global Right Sided Double Lumen Endobronchial Tube market size was estimated at USD 85.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
