Report Overview

Rilpivirine Hydrochloride is a pharmaceutical compound that serves as an antiretroviral medication, specifically a non-nucleoside reverse transcriptase inhibitor (NNRTI). It is used in combination with other antiretroviral agents for the treatment of human immunodeficiency virus (HIV) infection in adults. Rilpivirine Hydrochloride works by inhibiting the activity of reverse transcriptase, an enzyme essential for the replication of HIV. By blocking this enzyme, it prevents the conversion of viral RNA into DNA, thereby hindering the virus from multiplying and spreading within the body. This medication is crucial in managing HIV and reducing the viral load, which helps to slow the progression of the disease and improve the quality of life for those living with HIV.
