Report Overview

A Rod Capacitive Level Gauge, also known as a capacitance level gauge or capacitance probe, is a device used to measure the level of liquid or solid materials in tanks or vessels. It consists of a probe or rod made of a conductive material, usually stainless steel, inserted into the tank. The probe forms a capacitor with the tank wall, and as the level of the material changes, the capacitance between the probe and the tank wall also changes. This change in capacitance is used to determine the level of the material and provide accurate readings through electronic circuitry or digital displays.
