### Report Overview

Root canal filling paste is a specialized dental material used to seal the cleaned and shaped root canal system after endodontic treatment, preventing bacterial recontamination and promoting healing. It typically consists of a biocompatible, radiopaque base material such as zinc oxide eugenol (ZOE) or calcium hydroxide, often combined with additives like resins, polymers, or antimicrobial agents to enhance sealing properties and tissue compatibility. The paste is designed to adapt to the irregular canal anatomy, ensuring a tight seal while exhibiting minimal shrinkage or solubility over time. Its formulation may vary depending on clinical requirements, with some pastes offering extended antibacterial effects or bioactive properties to stimulate periapical tissue repair. The product plays a critical role in the long-term success of root canal therapy by creating a hermetic barrier against microbial invasion while maintaining patient comfort.
