Report Overview

Root fragment forceps are specialized surgical instruments designed for the precise extraction of dental root fragments during endodontic or oral surgical procedures. These forceps feature fine, angled tips with serrated or smooth surfaces to securely grasp and remove residual root fragments without causing further damage to surrounding tissues. Typically made from high-grade stainless steel for durability and sterilization compatibility, they are available in various designs, such as straight, curved, or bayonet-shaped, to accommodate different anatomical needs. Their primary use is in complex dental extractions where standard forceps may not provide sufficient grip or access, making them critical for minimizing complications and ensuring efficient root retrieval. The market for these instruments is driven by the growing demand for advanced dental care, increasing prevalence of periodontal diseases, and the rising number of dental surgeries worldwide.
