### Report Overview

Rubber on aluminum wheels refers to a hybrid wheel design where a rubber component is integrated with an aluminum rim, combining the durability and lightweight properties of aluminum with the vibration-dampening and shock-absorption benefits of rubber. These wheels are commonly used in high-performance vehicles, off-road applications, and industrial machinery where reduced noise, improved traction, and enhanced ride comfort are prioritized. The rubber element, often in the form of a ring or segmented inserts, helps mitigate road vibrations and impacts, while the aluminum structure ensures structural integrity and heat dissipation. This design bridges the gap between traditional all-metal wheels and solid rubber wheels, offering a balance of performance, weight efficiency, and cost-effectiveness. The market for such wheels is driven by demand from automotive, aerospace, and heavy equipment sectors seeking solutions that enhance durability without compromising on ride quality or fuel efficiency.
