Report Overview

(S)-(-)-1-Amino-1-Phenylpropane, also known as (S)-(-)-1-Phenylpropylamine, is a chiral amine compound with a phenyl group attached to a propylamine backbone, where the amino group is located at the first carbon position. This enantiomer is significant in pharmaceutical and chemical research due to its role as a chiral building block in the synthesis of active pharmaceutical ingredients (APIs), agrochemicals, and specialty chemicals. Its stereospecific properties make it valuable for asymmetric synthesis, particularly in the production of enantiomerically pure drugs, where the (S)-configuration often confers distinct biological activity. The compound is primarily used in research laboratories and pharmaceutical manufacturing, with demand driven by the growing emphasis on chiral purity in drug development and the expansion of personalized medicine. Market dynamics are influenced by regulatory standards, patent expirations of related drugs, and advancements in synthetic methodologies that improve yield and cost-efficiency. The niche nature of this compound means suppliers often cater to specialized chemical distributors and contract research organizations, with pricing reflecting its high purity and application-specific demand.
