## Abstracts

Pumps are the driving forces in fluid systems for nuclear power plants. The pump in each system drives the fluid through the piping to provide transfer of energy from one component to another. A pump is used in the main reactor circulating system to create the fluid flow that transfers the heated water to the steam generator. A pump provides the coolant flow that serves the steam condenser. There are pumps in all the fluid systems that make up a nuclear power plant. Fluid systems have varying degrees of importance depending on their function. The reactor cooling system is critical to maintaining the temperature of the fuel charge and transferring energy to the steam generator. The reactor coolant pump provides flow in this system. The steam system transfers energy from the steam generator to the turbine and then to the condenser. Cooling water supplied by a pump that circulates water from a coolant source through the condenser and back to its source condenses the steam. In addition to these primary fluid systems there are many others that provide for operation of the plant. Some of these systems are related to the safe operation of the power plant. This report studies pumps used for systems which are related to the safe operation of the power plant. Nuclear energy is an important clean, low-carbon, safe and efficient energy form in the world. It plays an indispensable role in global clean energy transformation, ensuring energy security, achieving carbon neutrality goals, and solving climate change problems. As of the end of 2022, a total of 422 nuclear power units were operating in 33 countries and regions around the world, with a total installed capacity of 378.314 million kilowatts. There are 57 nuclear power units under construction in 18 countries around the world, with a total installed capacity of 58.858 million kilowatts. It is expected that global power generation will reach 2.7 trillion kilowatt hours in 2022, accounting for approximately 9.6% of the global power structure. The development and adoption of nuclear power is a key driver of the market.

The global Safety Class Nuclear Pumps market size was estimated at USD 2162.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
