Report Overview

The SARS-CoV-2 IgG (RBD) ELISA is a laboratory diagnostic test designed to detect the presence of immunoglobulin G (IgG) antibodies specific to the Receptor Binding Domain (RBD) of the spike protein of the SARS-CoV-2 virus, which causes COVID-19. This enzyme-linked immunosorbent assay (ELISA) is a serological test that uses a solid-phase enzyme immunoassay to quantify the level of IgG antibodies in a patient's serum or plasma sample. The test is based on the principle of antigen-antibody interaction, where the RBD of the spike protein acts as the antigen, and the IgG antibodies in the sample serve as the antibodies. The presence and concentration of IgG antibodies against the RBD can indicate an individual's immune response to the SARS-CoV-2 virus, which may have implications for understanding past infections, immunity, and potential vaccine effectiveness. This test is crucial for epidemiological studies, assessing the spread of the virus in populations, and supporting public health decisions.
