Report Overview

A Saturation Diving System is an advanced underwater diving technology designed to enable divers to work at extreme depths for extended periods. This system allows divers to reach depths beyond the limits of conventional diving, typically exceeding 300 feet (90 meters), where the pressure is so high that the divers' bodies become saturated with the breathing gas. The system consists of a saturation diving chamber, where divers live and breathe a specific gas mixture while working at depth, and a diving bell that transports them to and from the worksite. The primary purpose of this system is to minimize the risk of decompression sickness, as divers can stay at depth for days or even weeks without needing to surface, thus reducing the time spent in decompression. Saturation diving systems are crucial for deep-sea exploration, construction, and repair operations in the oil and gas industry, as well as scientific research and salvage missions.
