Report Overview

Scalp cool devices are specialized medical or therapeutic tools designed to mitigate chemotherapy-induced hair loss (alopecia) by cooling the scalp before, during, and after treatment. The cooling constricts blood vessels, reducing the amount of chemotherapy drugs reaching hair follicles, thereby minimizing damage and preserving hair growth. These devices typically include cooling caps, scalp cooling systems, or wearable cooling apparatuses that maintain a controlled low temperature. They are increasingly used in oncology settings, offering a non-invasive solution to a distressing side effect of chemotherapy, improving patient quality of life, and reducing the psychological impact of hair loss. The market includes both clinical-grade systems used in hospitals and portable devices for home use, catering to different patient needs and treatment environments.
