### Report Overview

A scleral depressor is a specialized ophthalmic instrument used primarily during fundus examinations to manipulate and stabilize the eye, allowing for better visualization of the retina and peripheral ocular structures. It is commonly employed in procedures such as indirect ophthalmoscopy, where the physician applies gentle pressure to the sclera (the white outer layer of the eye) to examine areas that are otherwise difficult to access. The device is typically made of medical-grade materials like stainless steel or high-quality plastic, ensuring durability and patient safety. Scleral depressors come in various designs, including straight, curved, or with serrated tips, catering to different clinical needs and physician preferences. Their usage is critical in diagnosing retinal detachments, tumors, or other pathologies, making them an essential tool in ophthalmology clinics, hospitals, and specialized eye care centers. The market for scleral depressors is driven by the growing prevalence of retinal disorders, advancements in ophthalmic diagnostic techniques, and increasing demand for minimally invasive tools in eye care.
