Report Overview

Seasonal vaccines are a category of immunization products specifically designed to protect against infectious diseases that exhibit a predictable pattern of occurrence within certain seasons. These vaccines are typically administered annually and are formulated to target the most prevalent strains of viruses or bacteria during a specific season. The purpose of seasonal vaccines is to boost the immune system's ability to recognize and combat these pathogens, thereby reducing the risk of infection and the severity of illness. Examples include the influenza vaccine, which is updated each year to match the circulating flu strains, and vaccines for diseases like meningococcal meningitis, which may have seasonal peaks.
