## Abstracts

The secondary overvoltage protection chip is an electronic device usually used in circuits to protect electronic equipment from overvoltage damage. When an overvoltage situation occurs in the circuit, the secondary overvoltage protection chip will respond quickly and take measures to limit or shield the excessive voltage, thereby protecting subsequent circuits and equipment. These chips are usually designed to have high sensitivity, fast response speed, and low power consumption. They detect whether the input voltage exceeds a set threshold range and, if so, initiate a protection mechanism, typically by cutting off or limiting the current flow to the circuit to reduce the voltage level. Secondary overvoltage protection chips are widely used in various electronic devices, such as power adapters, battery chargers, electronic device interfaces, etc. Its main function is to protect equipment from damage caused by excessive voltage and improve equipment reliability and safety.

The global Secondary Overvoltage Protection Chip market size was estimated at USD 350.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
