Report Overview

A seismic base isolator is a structural device designed to mitigate the impact of seismic forces on buildings and infrastructure during an earthquake. Installed between a structure's foundation and superstructure, these isolators act as flexible connectors that allow controlled movement of the building. Typically composed of materials with damping properties, such as rubber or sliding bearings, seismic base isolators absorb and dissipate seismic energy, reducing the transmission of damaging forces to the structure. The purpose of these isolators is to enhance the seismic resilience of buildings, safeguarding them against potential damage and ensuring the safety of occupants by minimizing structural deformation during seismic events. This technology is widely employed in earthquake-prone regions to improve the seismic performance of various structures, including residential, commercial, and critical infrastructure buildings.
