Report Overview

Selective Catalytic Reductant (SCR) is a liquid-reductant agent, typically composed of urea and deionized water, used in diesel engine exhaust systems to reduce harmful nitrogen oxide (NOx) emissions by converting them into nitrogen and water through a catalytic reaction. The most common form of SCR fluid is AdBlue, a 32.5% urea solution standardized for use in vehicles and industrial machinery to comply with stringent environmental regulations like Euro 6 and EPA Tier 4. The system operates by injecting the reductant into the exhaust stream, where it reacts with NOx over a catalyst, significantly lowering emissions without compromising engine performance. SCR technology is widely adopted in automotive, heavy-duty trucks, marine, and power generation sectors as a cost-effective solution to meet emissions standards while maintaining fuel efficiency. The market for SCR is driven by global emission norms, increasing diesel vehicle production, and the push for cleaner air, though its growth is influenced by factors such as urea price volatility, infrastructure for refilling stations, and competition from alternative NOx reduction technologies like exhaust gas recirculation (EGR).
