Abstracts

A selective conformal coating machine is a specialized piece of equipment used in the electronics manufacturing industry to apply protective coatings selectively on specific areas of a printed circuit board (PCB) or electronic component. Unlike traditional conformal coating methods that cover entire surfaces, selective conformal coating machines utilize precision dispensing nozzles, programmable robotics, and advanced software controls to accurately apply coatings only where needed, avoiding sensitive areas such as connectors, sockets, and other components that must remain uncoated. This selective application not only enhances the protection of electronic assemblies against moisture, dust, chemicals, and temperature extremes but also ensures that the functional and mechanical integrity of the uncoated areas is maintained. These machines are integral to modern electronics production, offering high precision, efficiency, and the ability to handle complex and densely packed PCBs.

The global Selective Conformal Coating Machine market size was estimated at USD 380.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
