Abstracts

Selective Estrogen Receptor Modulators are a class of compounds that selectively bind to estrogen receptors and exert tissue-specific effects, mimicking or blocking estrogen's actions depending on the target tissue. Unlike estrogen itself, which generally has a uniform effect across various tissues, SERMs can act as estrogen agonists in some tissues while serving as antagonists in others. This selective activity allows SERMs to provide therapeutic benefits such as promoting bone health in osteoporosis or reducing the risk of certain cancers, like breast cancer, by modulating estrogen receptor activity in a targeted manner.

The global Selective Estrogen Receptor Modulators market size was estimated at USD 1832.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
