Report Overview

A Selective Wave Soldering System is an automated soldering technology used in the electronics manufacturing process to selectively apply solder to specific areas of a printed circuit board (PCB). This system employs a precision-controlled wave soldering process where molten solder is directed only to the predetermined soldering locations on the PCB. This selective approach is beneficial for components that require soldering on one side of the board while avoiding others. The system typically includes a conveyor that moves the PCB through a fluxing station, preheating zone, and the selective solder wave, ensuring accurate and controlled solder application. Selective wave soldering is commonly used for through-hole components and offers increased efficiency and reduced soldering defects in electronic assembly.
