Report Overview

Selexipag tablets are a selective prostacyclin receptor agonist primarily used to treat pulmonary arterial hypertension (PAH), a rare, progressive disease characterized by high blood pressure in the arteries of the lungs, leading to heart failure. The drug works by mimicking prostacyclin, a naturally occurring substance that dilates blood vessels and inhibits platelet aggregation, thereby reducing pulmonary vascular resistance and improving exercise capacity. Marketed under the brand name Upravi by Actelion Pharmaceuticals (now part of Johnson & Johnson), selexipag is indicated for long-term treatment in PAH patients (WHO Group 1) to delay disease progression and reduce hospitalization. The tablet form offers better patient compliance compared to intravenous or inhaled prostacyclin analogs, positioning it as a preferred option in PAH therapy. The market for selexipag tablets is driven by increasing PAH prevalence, rising diagnosis rates, and a growing emphasis on targeted therapies, though high treatment costs and limited awareness in developing regions may restrain growth. Key competitors include other prostacyclin pathway agents like epoprostenol and treprostinil, as well as endothelin receptor antagonists and phosphodiesterase-5 inhibitors. The market is expected to expand with ongoing clinical trials exploring combination therapies and potential label expansions.
