### Report Overview

A Self Aligned Ball Bearing is a type of rolling-element bearing that features a spherical or cylindrical outer ring raceway that is designed to automatically align itself with the inner ring raceway, accommodating angular misalignment between the shaft and the housing. This self-aligning capability reduces stress and wear on the bearing components, thereby increasing the bearing's service life and reliability. The bearing consists of an outer ring, an inner ring, and a set of balls that roll between the two races. The self-alignment is achieved through the spherical shape of the outer ring raceway, which allows the bearing to adjust to slight misalignments without causing excessive friction or damage. These bearings are commonly used in applications where there is a need for high load capacity, low friction, and the presence of misalignment, such as in industrial machinery, automotive components, and various types of rotating equipment.
