Abstracts

A self-priming progressing cavity pump is a specialized type of positive displacement pump designed to automatically remove air from the suction line and create a vacuum sufficient to draw fluid into the pump without requiring manual priming. It features a helical rotor turning within a helical stator, forming a series of sealed cavities that progressively move the fluid from the inlet to the discharge end. This self-priming capability makes it ideal for applications where the pump may encounter intermittent flow or needs to be primed frequently. Its robust design allows it to handle a wide range of fluids, including those with high viscosity, solids, and shear-sensitive materials. Self-priming progressing cavity pumps are commonly used in industries such as wastewater treatment, chemical processing, food and beverage, and oil and gas, where their ability to maintain efficient and continuous operation in challenging conditions is highly advantageous.

The global Self Priming Progressing Cavity Pump market size was estimated at USD 1245.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
