Report Overview

Semi-solid die casting, also known as thixocasting, is a manufacturing process that combines the principles of die casting and semi-solid metal processing. In this technique, the metal alloy is heated to a specific temperature, just below its melting point, to create a semi-solid state that consists of a slurry of solid particles suspended in a liquid matrix. This semi-solid metal is then injected into a die cavity under high pressure, where it solidifies to form a near-net-shape component. The process offers several advantages, including improved mechanical properties, reduced porosity, and the ability to produce complex shapes with thinner walls compared to traditional die casting. Semi-solid die casting is particularly suitable for producing high-quality components with good surface finish and dimensional accuracy, making it an attractive option for various industries, such as automotive, aerospace, and consumer electronics.
