### Report Overview

Semiconductor Design, Fabrication, and OSAT (Outsourced Semiconductor Assembly and Test) refers to the comprehensive process of designing, manufacturing, and testing integrated circuits (ICs) and other microelectronic components. This process begins with semiconductor design, where engineers use specialized software to create detailed plans for the desired functionality and performance of the IC. Following the design phase, fabrication involves the actual manufacturing of the semiconductor using advanced techniques such as photolithography, etching, and deposition to create layers of materials on a silicon wafer. Once the semiconductor is fabricated, OSAT companies take over to perform the assembly and testing processes. Assembly involves packaging the IC to protect it and facilitate its integration into electronic systems, while testing ensures the functionality and reliability of the semiconductor before it is shipped to customers. This entire process is critical for the production of high-performance, reliable, and cost-effective semiconductors that power modern electronics.
