### Report Overview

A Semiconductor Inspection System is a device that detects faults in a device during the manufacturing process of a semiconductor device. Semiconductor devices are completed by a large number of manufacturing processes. If a fault occurs during the process, there is no point in subsequent processing. This is only for the production of defective products. Therefore, by inserting an inspection process into the critical point of the manufacturing process, the device is confirmed to be free of defects before moving on to the next step. If a device failure is found, production is interrupted and the cause is then determined and the defect eliminated. Once the defects have been sufficiently reduced, the process moves on to the next manufacturing step.
