Abstracts

The working principle of semiconductor laser pumped solid-state laser (DPSSL) for laser marking is to use high-power semiconductor quantum well laser instead of gas lamp to pump solid-state crystal as a gain medium laser resonator, so that it can generate new wavelengths of laser light. The back-up frequency mixing interaction should produce lasers with wavelengths such as SHG and THG. Through design and establishment, the entire laser marking process, operating procedures and quality standards from re-inspection of incoming materials, assembly production, process inspection, final assembly and commissioning to finished product general inspection have been established.

The global Semiconductor Laser Marking Machine market size was estimated at USD 348.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
