Report Overview

Semiconductor VCSEL (Vertical-Cavity Surface-Emitting Laser) Lasers are advanced photonic devices that emit laser light perpendicular to the surface of the semiconductor material, as opposed to edge-emitting lasers. These lasers are constructed using a vertical cavity structure, which allows for efficient light emission from the top surface. They are primarily made from III-V semiconductor materials such as gallium arsenide (GaAs) or indium phosphide (InP). VCSEL lasers are known for their high efficiency, low threshold current, and circular beam profile. They are widely used in various applications, including data communication, optical sensing, consumer electronics, and medical devices, due to their compact size, reliability, and ability to be integrated into large arrays for high-speed data transmission. The performance of VCSEL lasers can be further enhanced through advanced fabrication techniques and the incorporation of novel materials, making them a critical component in the rapidly evolving field of photonics.
