Report Overview

A Shielding Braid, also known as a shielded braid or drain wire, is a type of electrical conductor that is specifically designed to provide electromagnetic shielding for various applications. It is typically made from a stranded wire, composed of multiple thin strands of metal, which are woven together to form a flexible and robust structure. The primary function of a Shielding Braid is to protect sensitive electronic equipment from electromagnetic interference (EMI) and radio frequency interference (RFI) by acting as a Faraday cage, effectively blocking external electromagnetic fields. This is achieved by the braid's ability to absorb and redirect the interference, thereby preventing it from reaching the internal components of the device. Shielding Braids are commonly used in cable assemblies, particularly in high-speed data transmission and signal processing applications, where minimizing interference is crucial for maintaining signal integrity and performance.
