### Report Overview

Shore-to-Ship Power, also known as Cold Ironing, is a system that provides electricity to ships while they are docked at a port, allowing them to turn off their auxiliary engines and reduce emissions. This technology enables ships to draw power from the port's electrical grid instead of relying on their own onboard generators, thereby reducing fuel consumption, noise pollution, and greenhouse gas emissions. Shore-to-Ship Power systems typically involve the installation of specialized electrical infrastructure at the port, including transformers, cables, and connectors, which are designed to interface with the ship's electrical systems. The implementation of this technology not only contributes to environmental sustainability but also offers economic benefits by reducing operational costs for ship operators and improving air quality in port cities.
