Report Overview

A Shoulder Surgery Brace, also known as a shoulder immobilizer or shoulder support, is a medical device designed to provide support and immobilization to the shoulder joint following surgical procedures. It is typically made from a combination of rigid and flexible materials, such as plastic, foam, or fabric, to ensure stability while allowing for some degree of comfort. The brace is designed to limit the range of motion of the shoulder, thereby reducing the risk of complications and promoting healing. It is often used in the recovery phase after surgeries such as rotator cuff repairs, shoulder replacements, or other joint stabilization procedures. The brace may also feature adjustable straps to ensure a secure fit and can be worn on either the left or right shoulder, depending on the surgical site. Compliance with wearing the brace as prescribed by a healthcare professional is crucial for optimal recovery and to prevent postoperative complications.
