Report Overview

The SIDAC (Silicon Diode for Alternating Current) thyristor is a specialized semiconductor device designed for high-voltage switching applications, functioning as a bidirectional trigger diode that conducts current only after a specific breakover voltage is reached. It combines characteristics of thyristors and DIACs (Diode for Alternating Current), making it suitable for precise voltage-triggered control in AC circuits, such as in lighting control, motor drives, and surge protection systems. Unlike conventional thyristors, SIDACs operate symmetrically for both positive and negative voltage polarities, providing reliable performance in AC environments. Their ability to handle high surge currents and maintain stable triggering thresholds makes them valuable in industrial automation, power electronics, and consumer electronics where robust overvoltage protection or controlled switching is required. The device's niche application lies in its capacity to replace mechanical relays or gas discharge tubes in circuits demanding repeatable, noise-free triggering without physical wear.
