Report Overview

A Signal Isolator Unit is an electronic device designed to isolate, protect, and transmit signals between two separate electrical systems or circuits. It serves as a barrier to prevent electrical noise, ground loops, and potential damage caused by voltage spikes or surges. The primary function of this unit is to maintain signal integrity and ensure reliable communication between the connected systems. The Signal Isolator Unit typically consists of input and output terminals, an isolation barrier, and a power supply. It operates by converting the input signal into an isolated output signal, which is then transmitted to the receiving system without any electrical connection between the two. This isolation helps to eliminate interference, reduce signal degradation, and enhance the overall performance and reliability of the connected systems.
