Abstracts

The Silbroncho double-lumen bronchial catheter is a specially designed medical device, mainly used for lung isolation and single-lung ventilation in thoracic surgery. The Silbroncho double-lumen endobronchial tube is D-shaped, with a bendable and wire-reinforced lumen. This design allows it to be inserted into the bronchus at an angle greater than 50° without causing the bronchial lumen to twist. The Silbroncho tube is particularly suitable for patients who need lung isolation after left upper lobectomy. Since the expansion of the left lower lobe of the lung may cause the left bronchus (LMB) to rotate upward and form a 90° angle with the trachea, the conventional double-lumen endobronchial tube (DLT) needs to be twisted before it can be placed in the left main bronchus. The Silbroncho tube can adapt to this anatomical structure more smoothly, improving the accuracy and safety of placement. When using the Silbroncho tube, bronchial intubation is not required, and lung isolation can be achieved without placing a blocking balloon (BB) under the guidance of a fiberoptic bronchoscope. In addition, the tube is equipped with a camera that can continuously provide a real-time intraluminal view of the location, facilitating the initial placement of the lumen and correcting intraoperative misalignment, greatly reducing the dependence and cost of fiberoptic bronchoscopes.

The global Silbroncho Double Lumen Endobronchial Tube market size was estimated at USD 85.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
